

Cyclistic Bike-Share Analysis

How Can a Bike-Share Company Increase Annual Memberships?

Google Data Analytics Capstone Project

BUSINESS TASK

Analyze one year of Cyclistic trip data to identify behavioral differences between annual members and casual riders and provide recommendations to increase annual memberships.

DATA SOURCES

This analysis uses Cyclistic's public trip data from July 2025 to June 2026, containing ride details such as rider type, bike type, trip duration, dates, and station information.

DATA CLEANING

Combined 12 monthly datasets, removed duplicate and invalid rides, converted date fields, calculated ride length, created time-based features (weekday, month, hour), and prepared the final dataset using Python and SQL.

SUMMARY OF ANALYSIS

Exploratory analysis compared ride frequency, ride duration, weekday usage, monthly trends, bike preferences, and popular stations between annual members and casual riders using Python, SQL, and Tableau.

DASHBOARD

KEY FINDINGS

- Annual members generated most rides.
- Casual riders took longer trips.
- Casual usage increased on weekends.
- Summer had the highest ride activity.
- Members showed more consistent riding patterns.

RECOMMENDATIONS

- Convert weekend riders into members.
- Launch seasonal membership campaigns.
- Promote memberships at high-traffic stations.
